2.2 Content Research and Sourcing

Content research and sourcing were carried out before the development of the NovaTech Computer Solutions website to determine what information, visual material and supporting resources would be required for each of the six planned web pages. This stage was important because website content needs to support both the purpose of the business and the information needs of its intended users. Rather than adding information randomly during HTML development, the content was planned according to the purpose of the Home, About Us, Products, Services, Enquiry and Contact pages.

NovaTech Computer Solutions is a fictional technology business created specifically for this project. Therefore, organisation-specific information such as the company background, mission, vision, values, product descriptions, service descriptions, contact information and customer facing text was developed as original project content. Creating this information specifically for NovaTech helped maintain a consistent business identity and ensured that the written content remained relevant to the website's intended target audience.

External research was used where the project required information or resources that were not created originally. Technical guidance relating to HTML5 and semantic website structure was supported using MDN Web Docs, while suitable technology photographs were sourced from Unsplash for use across the Home, About Us, Products and Services pages. External material was considered according to its relevance, credibility and permitted usage before being incorporated into the project. Sources used during development were recorded in the Source Tracking Table so that original content could be clearly distinguished from externally sourced material.

The research process also considered how the information would eventually be presented in HTML5. Written content was divided into suitable headings, paragraphs and lists, while visual material was selected to support rather than replace the written information. Interactive requirements were considered for the Enquiry page, where an HTML form would be required to collect customer information, and the Contact page was planned to provide clear business contact details. This preparation created a direct connection between the research stage and the later HTML development of the website.

All external material used in the project is acknowledged using IIE Harvard Anglia referencing. Maintaining a record of sources supports academic integrity and also provides evidence of where external technical information and media originated. Original NovaTech content does not require an external reference because it was produced specifically for this project.

Content for the NovaTech Computer Solutions website will be researched and organised according to the purpose of each webpage. The research will focus on ensuring that customers receive relevant, clear and useful information about the business, its products and its services.

Business Information:

Information about NovaTech Computer Solutions will include the business background, target customers, contact details, operating hours and the main purpose of the business. This information will mainly be used on the Home, About Us and Contact pages.

Product Research:

Research will be conducted on computer-related products that are relevant to NovaTech's target customers. This may include laptops, desktop computers, computer accessories and related IT equipment. Product information will be organised so that customers can easily understand the type of products offered by the business.

Service Research:

Information will be researched for the IT services offered by NovaTech, including computer and laptop repairs, software installation, networking solutions and general IT support. The information will explain each service clearly so that customers can identify which service is suitable for their needs.

Target Audience Research:

The website content will be developed with NovaTech's target audience in mind, including students, home users, schools and small businesses in Johannesburg. The content will therefore use clear language and provide information that is relevant to the common computer and IT needs of these customers.

Images and Visual Content:

Relevant images will be selected to support the products and services presented on the website. Images will be appropriately named and organised within the project folders. Where external images or information are used, the original sources will be acknowledged in the project's reference list.

Organisation of Research:

Research material, references, planning documents and supporting information will be stored in the Content and Research folder. This will make the sources used during website development easier to identify and manage.

Website Content Requirements

The content requirements were planned separately for each of the six website pages to ensure that every page has a clear purpose and provides information relevant to NovaTech's customers. This planning prevents unnecessary repetition between pages and ensures that important business information is placed where users would logically expect to find it. The table below identifies the content required for each page and explains how that content contributes to the overall purpose of the website.

Web page	Content requirement	purpose
Home	Business introduction, slogan, short overview of products and services, key contact information	Introduce NovaTech and help visitors quickly understand what the business offers.
About us	Company background, mission, vision, values and target customers	Give visitors more information about NovaTech and build confidence in the business.
Product	Computers, laptops, accessories and custom PC options, with suitable descriptions and images	Present the main technology products available from NovaTech.

Service	Computer repairs, software installation, networking, virus	Explain NovaTech's services and help customers identify the support they require.
	removal, data backup and IT support	
Enquire	Enquiry/quotation form fields, service or product selection and customer contact details	Allow customers to submit product, service or quotation enquiries.
Contact	Telephone number, email address, Johannesburg location, operating hours and contact information	Make it easy for customers to contact or locate the business.

The Home page is designed to provide the first introduction to NovaTech Computer Solutions. It presents the business name, slogan and a brief overview of the products and services available so that visitors can quickly understand the purpose of the website. Key information is kept concise because the Home page acts as the starting point from which users can navigate to more detailed sections of the website.

The About Us page provides more detailed organisational information, including the company background, mission, vision, values and intended customers. This content helps establish the identity of NovaTech and gives visitors a clearer understanding of the business and what it aims to provide.

The Products page focuses on the technology products offered by NovaTech, including laptops, desktop computers, accessories and custom PC options. Product descriptions are supported by relevant images so that visitors can identify the different product categories more easily. The Services page performs a different role by explaining the technical support available, including computer repairs, software installation, networking, virus removal, data backup and IT support.

The Enquiry page is designed to support communication between potential customers and the business. It provides an enquiry and quotation form through which users can supply their contact information and indicate the product or service they are interested in. The Contact page complements this by providing NovaTech's telephone number, email address, Johannesburg location, operating hours and other contact information. Together, these pages provide users with clear methods of requesting assistance or contacting the business directly.

Planning the content in this way ensures that each page performs a distinct role while contributing to the overall purpose of the website. It also creates a logical relationship between the content plan and the sitemap, because the six content areas identified during research correspond directly with the six HTML pages created during development.

Content and Media Sources

The NovaTech Computer Solutions website uses a combination of original project content and externally sourced material. Original content was created specifically for the fictional NovaTech business and includes the company background, mission, vision, values, product descriptions, service descriptions, enquiry information and contact details. Developing this material specifically for the project ensures that the written content remains consistent with the purpose, identity and target audience of the proposed business.

External sources were used only where additional resources or technical guidance were required. MDN Web Docs was used as a technical reference for HTML5 structure and semantic elements during website development. Using a recognised technical documentation source helped support decisions about the appropriate HTML elements required to organise website content.

External visual resources were also required because original technology photographs were not produced specifically for the project. Suitable technology-related images were therefore selected from Unsplash for use across the website. Images were chosen according to their relevance to the surrounding content. For example, laptop, desktop and accessories images support the Products page, while computer repair imagery supports the Services content. The selected files were renamed descriptively and organised within the website's dedicated images folder before being referenced in the HTML pages.

Source ownership and referencing were considered during the selection process. Original project content is identified as such in the Source Tracking Table and therefore does not require an external citation. External technical information and image resources are recorded separately so that their origins can be acknowledged. External sources used in the project are included in the Reference List using IIE Harvard Anglia referencing. This approach helps distinguish the student's original work from third-party resources and supports appropriate academic practice.

Source Tracking Table

Resource/content	Purpose	Source	Usage/ ownership	Reference
NovaTech company information	About us and home page	Original content	Created specifically for this project	No
Product description	Product page	Original content	Created specifically for this content	No
IT Services description	Service page	Original project content	Created specifically for this project	No
HTML5 GUIDENCE	Correct html structure and semantic elements	MDN web docs	External technical reference	Yes

Technology photograph	Product, services and home page	Unsplash	Images sourced from Unsplash and used in Accordance with the applicable Unsplash licence. Source acknowledged in the Reference List.	Yes
Enquiry and contact content	Enquiry and contact page	Original project content	Created specifically for this project	No

Evidence of Content and Media Research

The following evidence shows the visual resources selected and organised for use in the NovaTech Computer Solutions website. Technology-related images were selected to support the written content on the Home, About Us, Products and Services pages. The image files were stored in a dedicated images folder using clear and descriptive filenames so that they could be referenced consistently during HTML development.

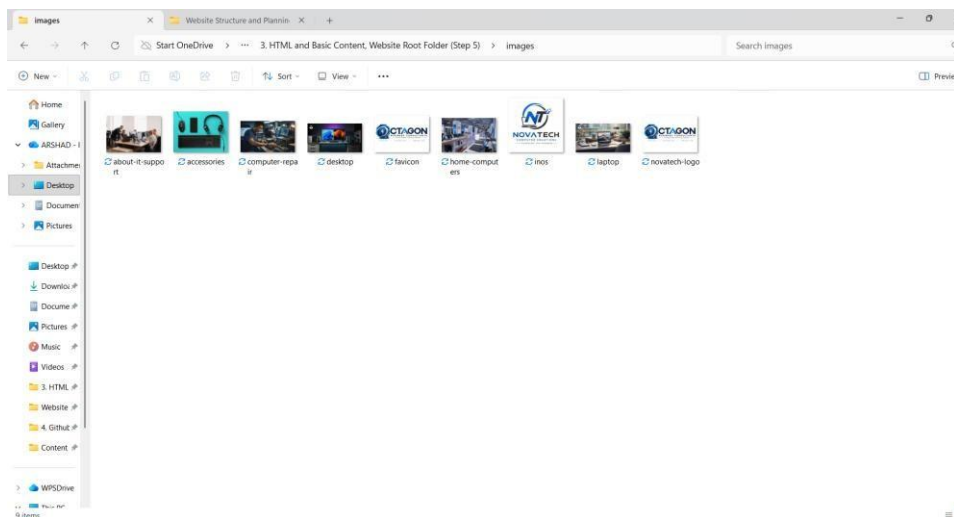

Figure 1: Organised image assets selected for the NovaTech Computer Solutions website

Figure 1 provides evidence of the image assets prepared for the NovaTech Computer Solutions website. Descriptive filenames were assigned according to the intended purpose of each image, including home-computers, about-it-support, laptop, desktop, accessories and computerrepair. This naming approach makes the resources easier to identify during HTML development and reduces confusion when creating relative image paths. The selected images support different areas of the website, with product-related images used to visually represent laptops, desktop computers and accessories, while the remaining images support the Home, About Us and Services content. All image assets were stored together in the dedicated images folder to maintain an organised website structure.

Website Content Preparation

Website content was prepared and organised before being implemented in HTML5. This preparation ensured that each of the six pages contained information directly related to its purpose and to the needs of NovaTech Computer Solutions' intended customers. Content was reviewed and separated into logical sections so that visitors would not be presented with large amounts of unstructured information.

A clear content hierarchy was planned for each page. Main page titles were identified as primary headings, while supporting topics were organised using subheadings, paragraphs and lists. Lists were particularly suitable for presenting products, services, business values and other grouped information because they allow visitors to scan important details quickly. Relevant images were selected to complement the written information and provide visual context for the products and technical services being described.

Navigation content was also prepared consistently across all six pages. The same page names— Home, About Us, Products, Services, Enquiry and Contact—were used throughout the website so that visitors would encounter a predictable navigation system. Relative links were planned between the HTML files to ensure that the complete website could continue functioning when the project folder was moved or submitted on another computer.

The Enquiry page required additional preparation because it performs an interactive function. Appropriate form fields were identified to collect customer details and enquiry information, while

required fields were planned so that basic HTML validation could be used. The Contact page was prepared with essential business information such as telephone, email, location and operating hours so that visitors could easily identify alternative methods of contacting NovaTech.

Once the written content, visual resources, navigation requirements and form information had been prepared, they were implemented using appropriate HTML5 elements. This preparation reduced unnecessary changes during development and helped ensure consistency between the original content plan, the sitemap and the final six-page website.

Evidence of Content Implementation

The following evidence demonstrates how the planned written content and selected media were implemented in the completed HTML5 website. The browser output shows that the prepared headings, paragraphs, navigation links and visual resources were successfully incorporated into the website pages.

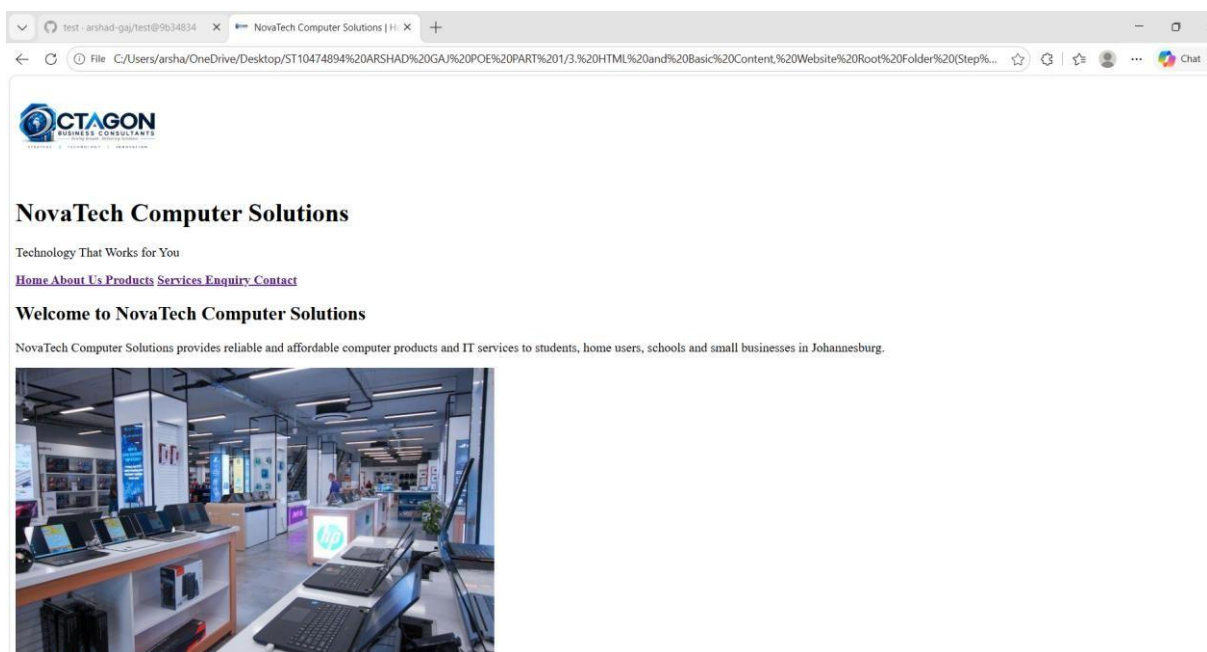

Figure 2: Implementation of planned content and media on the NovaTech Home page

Figure 2 demonstrates how the content identified during the research and preparation stage was implemented on the completed Home page. The page combines the NovaTech business identity, navigation links, written introductory content and selected visual media. This provides evidence that

the content planning process was carried through into the HTML5 implementation rather than remaining only as a written plan.
