

Goals and Objectives

Objectives

The objectives of the NovaTech Computer Solutions website are to:

- Develop a professional website containing Home, About Us, Products, Services, Enquiry and Contact pages.
- Provide clear and organised information about NovaTech's computer products, repair services, software installation, networking solutions and IT support.
- Allow customers to submit enquiries and request information about products and services through a dedicated enquiry page.
- Provide customers with easy access to NovaTech's contact details, operating hours and business information.
- Create simple and consistent navigation so that users can move easily between all pages of the website.
- Develop the website so that it can be accessed effectively on different devices as the project progresses into responsive design.

Current Analysis

NovaTech Computer Solutions is a proposed IT business in Johannesburg that provides computer and laptop sales, repairs, software installation, networking solutions and general IT support. Currently, the business does not have a dedicated website and mainly depends on telephone communication, social media and word-of-mouth referrals to communicate with potential customers.

This current approach limits the business because customers do not have one central platform where they can easily find information about NovaTech's products and services. Customers may need to contact the business directly to ask about available products, repair services, operating hours or other general information. This can be inconvenient for customers and may also result in staff repeatedly answering similar questions.

The lack of a website also limits NovaTech's online visibility. Potential customers searching online for computer repairs, IT support, networking services or computer products in Johannesburg may not easily find sufficient information about the business. This can reduce NovaTech's ability to reach new customers, especially students, home users, schools and small businesses that regularly use the internet when looking for IT products and services.

Customer enquiries are another area that can be improved. Relying mainly on telephone calls and social media messages can make enquiries more difficult to organise and manage. A dedicated website enquiry page would provide customers with a structured method of requesting information about products and services. The

website would also provide contact details, operating hours and other important business information in one location.

The proposed website will therefore address the limitations of NovaTech's current situation by creating a central and professional online presence. Customers will be able to access important information about the business at any time, browse available products and services and submit enquiries more easily. This will improve communication with customers and provide NovaTech with a stronger foundation for developing its online presence.

Proposed Website Features and Functionality

The NovaTech Computer Solutions website will include the following features and functionality:

Home Page:

The Home page will introduce NovaTech Computer Solutions and provide visitors with an overview of the business. It will highlight the main products and IT services offered and provide navigation to the other sections of the website.

About Us Page:

The About Us page will provide information about NovaTech Computer Solutions, including the background of the business, its purpose and the type of customers it aims to serve. This will help visitors understand the business and build confidence in the services being offered.

Products Page:

The Products page will display the computer-related products available from NovaTech. Products will be presented with relevant information and images so that customers can understand what the business offers before making an enquiry.

Services Page:

The Services page will provide detailed information about NovaTech's services, including computer and laptop repairs, software installation, networking solutions and general IT support. This will help customers identify the service that meets their needs.

Enquiry Page:

The Enquiry page will contain a structured form that customers can use to request information about NovaTech's products and services. Customers will be able to enter their details and specify the nature of their enquiry, providing a more organised method of communication than relying only on telephone calls or social media messages.

Contact Page:

The Contact page will provide important business information such as NovaTech's contact details, operating hours and location information. This will make it easier for customers to contact or locate the business.

Website

Navigation:

A consistent navigation menu will be available throughout the website, allowing visitors to move between the Home, About Us, Products, Services, Enquiry and Contact pages without difficulty.

4. Design Aesthetic

The NovaTech Computer Solutions website will use a modern and professional technology-focused design. The visual appearance will be kept clean and organised so that customers can easily read information and navigate through the website.

The main colour scheme will consist of dark blue, white and orange. Dark blue will be used as a primary colour because it creates a professional technology-based appearance. White will be used mainly for backgrounds and content areas to improve readability, while orange will be used as an accent colour for important elements such as buttons, links and highlighted information. The same colour scheme will be maintained throughout all pages to create visual consistency.

Typography will use a clear and readable sans-serif font with a consistent hierarchy. Larger and bolder text will be used for main headings, followed by smaller subheadings and normal-sized body text. Appropriate spacing between headings, paragraphs, images and other page elements will prevent the website from appearing overcrowded.

The website layout will maintain consistent navigation, headers, content sections and footers across the different pages. Product and service information will be organised into clearly separated sections, while relevant images will be used to support the written content without distracting users.

The design will also be responsive so that the website maintains a professional appearance on desktop computers, tablets and mobile phones. Page layouts, navigation, images and text will adjust according to the available screen size, allowing customers to use the website comfortably across different devices.

5. Technical Requirements

The following technical requirements will be used for the development and testing of the NovaTech Computer Solutions website:

Hardware Requirements:

A laptop or desktop computer will be required to develop, edit and test the website. The computer must have sufficient storage and memory to run the code editor, web browsers and other development tools. A smartphone or tablet can also be used during testing to check how the website appears and functions on different screen sizes.

Software Requirements:

A code editor such as Visual Studio Code will be used to create and edit the website files. HTML5 will be used to structure the website content, while CSS3 will be used to control the layout, colours, typography and responsive design. Web browsers such as Google Chrome and Microsoft Edge will be used to test the website and identify display or compatibility problems.

Development and File Requirements:

The website will use separate HTML files for the Home, About Us, Products, Services, Enquiry and Contact pages. An external CSS stylesheet will be linked to all pages to maintain consistent styling. Images and other website resources will be stored in organised folders using clear file names and relative file paths.

Testing Requirements:

The website will be tested at different screen sizes to ensure that it displays correctly on desktop, tablet and mobile devices. Browser developer tools will be used to test responsive layouts and identify problems with navigation, images, spacing or page content.

Version Control and Repository Requirements:

Git and GitHub will be used for version control. Changes to the website will be committed regularly using descriptive commit messages and pushed to the remote GitHub repository. The README file will also be updated throughout development to record important project information and changes.

Timeline

The NovaTech Computer Solutions website will follow a structured four-week development schedule. Each week will focus on a specific stage of the project to ensure that sufficient time is available for planning, development, testing and final improvements.

Week	Development Stage	Activities
Week 1	Planning and Research	Review the project requirements, research website content, identify the target audience, define website goals and objectives, plan the sitemap and prepare the website structure.

Week 2	HTML Development	Develop the Home, About Us, Products, Services, Enquiry and Contact pages using HTML5. Add the required text, images, navigation menus, forms and other website content.
Week 3	CSS Styling and Responsive Design	Create and link the external CSS stylesheet. Apply the colour scheme, typography, spacing and page layouts. Use Flexbox or CSS Grid and media queries to make the website responsive for desktop, tablet and mobile devices.
Week 4	Testing and Final Improvements	Test all website pages, links, forms, images and navigation. Test the responsive design at different screen sizes and browsers. Correct identified problems, update the README and changelog, complete GitHub commits and prepare the final project for submission.

7. Budget

The estimated budget for the development of the NovaTech Computer Solutions website is R2,500.

The budget covers the main resources and services that may be required to develop, test and prepare the website.

Items	Estimated cost	purpose
Domain name registration	R250	Registration of a suitable domain name for the NovaTech website.
Web hosting	R750	Hosting the website so that it can be accessed online.
Internet/Data	R400	Research, downloading resources, testing and uploading project files.
Graphics and website resources	R300	Images, graphics and other resources that may be required for the website
Development and testing expenses	R500	Costs associated with website development and testing activities.
Contingency	R300	Reserved for unexpected project-related expenses.
Total Estimated Budget	R2500	

Content Research and Sourcing

8. Content Research and Sourcing

Content for the NovaTech Computer Solutions website will be researched and organised according to the purpose of each webpage. The research will focus on ensuring that customers receive relevant, clear and useful information about the business, its products and its services.

Business Information:

Information about NovaTech Computer Solutions will include the business background, target customers, contact details, operating hours and the main purpose of the business. This information will mainly be used on the Home, About Us and Contact pages.

Product Research:

Research will be conducted on computer-related products that are relevant to NovaTech's target customers. This may include laptops, desktop computers, computer accessories and related IT equipment. Product information will be organised so that customers can easily understand the type of products offered by the business.

Service Research:

Information will be researched for the IT services offered by NovaTech, including computer and laptop repairs, software installation, networking solutions and general IT support. The information will explain each service clearly so that customers can identify which service is suitable for their needs.

Target Audience Research:

The website content will be developed with NovaTech's target audience in mind, including students, home users, schools and small businesses in Johannesburg. The content will therefore use clear language and provide information that is relevant to the common computer and IT needs of these customers.

Images and Visual Content:

Relevant images will be selected to support the products and services presented on the website. Images will be appropriately named and organised within the project folders. Where external images or information are used, the original sources will be acknowledged in the project's reference list.

Organisation of Research:

Research material, references, planning documents and supporting information will be stored in the Content and Research folder. This will make the sources used during website development easier to identify and manage.

Website structure and planning novatech

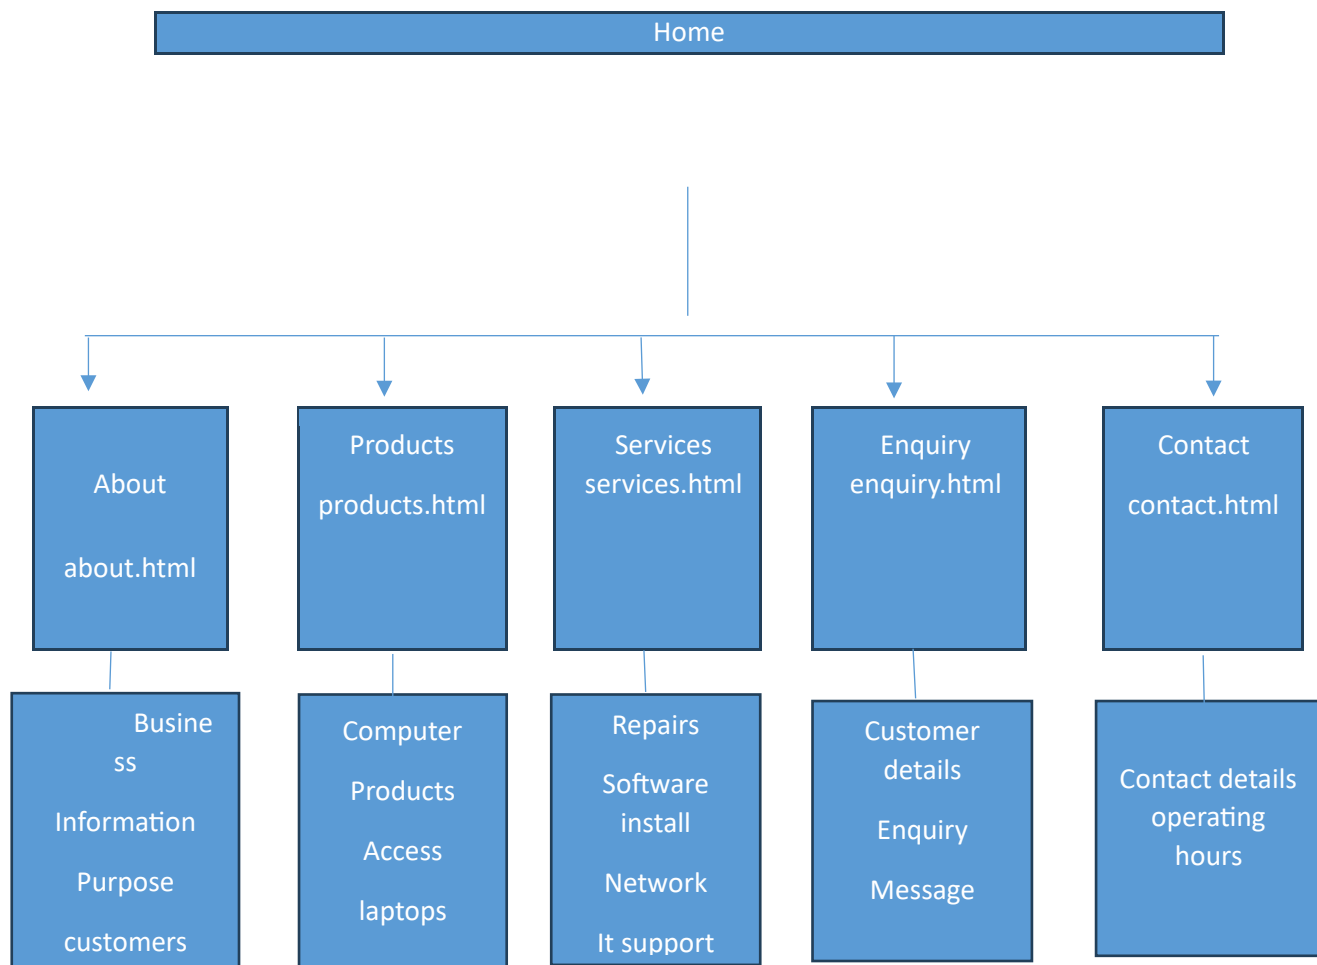

Figure 1: Proposed sitemap for the NovaTech Computer Solutions website

The website uses a simple hierarchical structure. All six main pages are accessible through the main navigation menu, allowing users to move directly between sections without returning to the Home page first. The additional information shown underneath each page in the sitemap identifies the main type of content that users can expect to find on that page.
